| 1. PROCESS LANDSCAPE .....  | 3  |
| 2. BPMN Service Level Diagram.....  | 4  |
| 3. USE CASES.....   | 5  |
| 3.1. Actors Involved .....  | 5  |
| 3.2. CONFIGURE MOBILITY CLASSIFIER – Use Cases .....                                  | 6  |
| 3.2.1. Customer Registration – Use Case (Fabio Malloggi) .....                        | 6  |
| 3.2.2. Customer’s Category Assignment – Use Case (Fabio Malloggi) .....               | 7  |
| 3.3. PREPARE MOBILITY SESSION – Use Cases .....                                       | 8  |
| 3.3.1. Configure Ingestion System – Use Case (Fabio Malloggi) .....                   | 8  |
| 3.3.2. Configure Preparation System – Use Case (Fabio Malloggi) .....                 | 9  |
| 3.4. GENERATE MOBILITY SESSIONS SET – Use cases.....                                  | 11 |
| 3.4.1 CONFIGURE SEGREGATION SYSTEM – Use Case (Lorenzo Tonelli) .....                 | 11 |
| 3.4.2 CHECK DATA BALANCING – Use Case (Lorenzo Tonelli).....                          | 12 |
| 3.4.3 CHECK SESSIONS QUALITY – Use Case (Fabio Malloggi).....                         | 13 |
| 3.5. DEVELOPMENT MOBILITY CLASSIFIER – Use cases .....                                | 16 |
| 3.5.1. CONFIGURE DEVELOPMENT SYSTEM - Use Case (Francesco Marabotto).....             | 16 |
| 3.5.2. ADJUST NUMBER OF GENERATIONS ON TRAINING – Use Case (Francesco Marabotto)..... | 17 |
| 3.5.3. SELECT THE BEST CLASSIFIER – Use Case (Francesco Marabotto) .....              | 18 |
| 3.5.4. DEPLOY MOBILITY CLASSIFIER - Use Case (Ludovica Cocchella).....                | 19 |
| 3.6. CLASSIFY MOBILITY SESSION – Use Cases .....                                      | 20 |
| 3.6.1. CONFIGURE EXECUTION SYSTEM - Use Case (Ludovica Cocchella).....                | 20 |
| 3.7. CHECK MOBILITY CLASSIFIER – Use Cases .....                                      | 21 |
| 3.7.1. CONFIGURE MONITORING SYSTEM - Use Case (Ludovica Cocchella) .....              | 22 |
| 3.7.2. EVALUATE CLASSIFICATION REPORT - Use Case (Ludovica Cocchella).....            | 23 |
| 4. SIMULATION MODELS .....  | 25 |
| 4.1. AS-IS Model .....  | 25 |
| 4.2. TO-BE Model.....   | 30 |
| 4.3. BIMP Conclusion.....   | 33 |
| 5. PROCESS MINING .....   | 34 |
| 5.1. Normative Process Mining and Evaluation .....                                    | 34 |
| 5.1.1 Bimp Normative Log Generation for Mining .....                                  | 34 |
| 5.1.2 Disco Normative Model.....  | 36 |
| 5.1.3 Apromore Normative Model .....  | 37 |
| 5.1.4 Comparison between Disco Transition Map and Apromore Process Map .....          | 37 |
| 5.1.4.1 Conformance Checking on Apromore BPMN Model.....                              | 37 |

|   |    |
|---|----|
| 5.1.5 ProM Normative Model.....   | 39 |
| 5.2. Normative Process Evaluation against Log Violations.....                                 | 41 |
| 5.2.1. Introducing Log Violations .....   | 41 |
| 5.2.2 Disco Model with Violations .....   | 42 |
| 5.2.3. Apromore Model with Violations .....   | 42 |
| 5.2.4. Comparison between Disco and Apromore Models with Violations .....                     | 43 |
| 5.2.5. Conformance Checking Apromore Normative Model against Violations .....                 | 43 |
| 5.2.5. ProM Model against Violations .....  | 46 |
| 5.3 Evaluate Models Quality Dimensions.....   | 48 |
| 5.3.1. Comparison between Apromore and ProM Models Quality Dimensions.....                    | 49 |
| 5.3.2. Comparison between Apromore and ProM Models Quality Dimensions with Modified Log.....  | 49 |
| 5.3.3. Comparison between ProM with and without Violations Models Quality Dimensions.....     | 49 |
| 5.3.4. Comparison between Apromore with and without Violations Models Quality Dimensions..... | 50 |

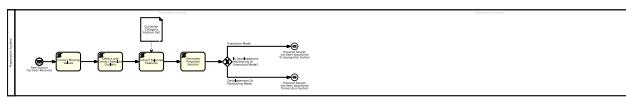

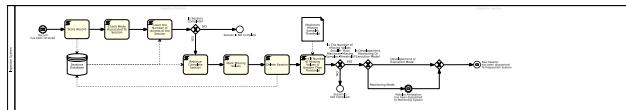

# 1. PROCESS LANDSCAPE

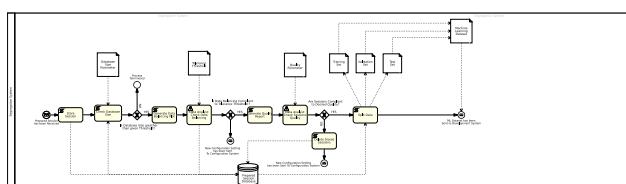

## 2. BPMN Service Level Diagram

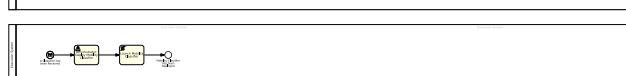

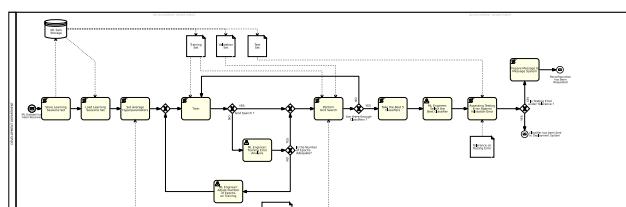

**PREPARE MOBILITY SESSION (FABIO MALLOGGI)**

GENERATE MOBILITY SESSIONS SET (LORENZO TONELLI)

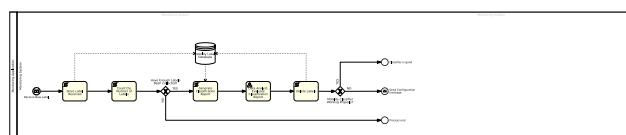

DEVELOPE MOBILITY CLASSIFIER (FRANCESCO MARABOTTO)

CLASSIFY MOBILITY SESSION (LUDOVICA COCCHELLA)

CHECK MOBILITY CLASSIFIER (LUDOVICA COCCHELLA)

### 3. USE CASES

#### 3.1. Actors Involved

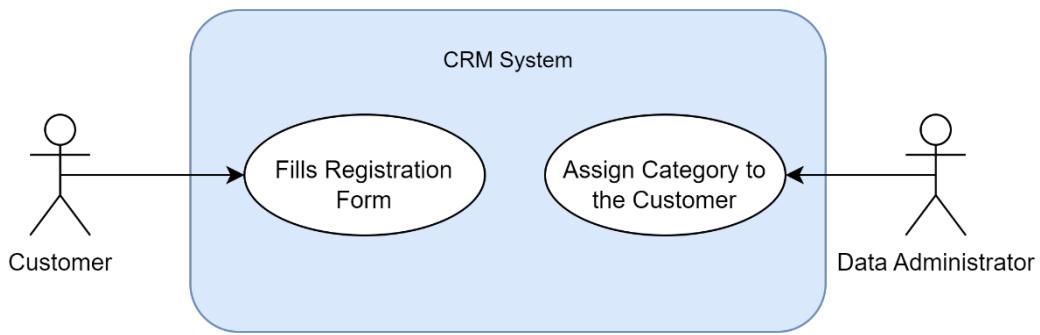

| ACTOR              | LINK  | COST (\$/hour)          | NORMALIZED COST |
|--------------------|---|-------------------------|-----------------|
| ADMINISTRATOR      | <a href="https://www.prospects.ac.uk/job-profiles/information-systems-manager">https://www.prospects.ac.uk/job-profiles/information-systems-manager</a> | 18<br>(Annual 36.000\$) | 1               |
| DATA ANALYST       | <a href="https://www.prospects.ac.uk/job-profiles/data-analyst">https://www.prospects.ac.uk/job-profiles/data-analyst</a>                               | 21<br>(Annual 42.000\$) | 1.17            |
| DATA ADMINISTRATOR | <a href="https://www.prospects.ac.uk/job-profiles/database-administrator">https://www.prospects.ac.uk/job-profiles/database-administrator</a>           | 27<br>(Annual 54.000\$) | 1.5             |
| ML ENGINEER        | <a href="https://www.prospects.ac.uk/job-profiles/machine-learning-engineer">https://www.prospects.ac.uk/job-profiles/machine-learning-engineer</a>     | 33<br>(Annual 66.000\$) | 1.83            |
| CUSTOMER           |   | 0                       | 0               |

£ to \$ conversion: 1 £ = 1.2 \$

COST (\$/hour) = Annual Salary (\$) / (50 weeks \* 40 hours per week)

50 weeks because 2 weeks are considered as public holidays.

### 3.2. CONFIGURE MOBILITY CLASSIFIER – Use Cases

#### 3.2.1. Customer Registration – Use Case (Fabio Malloggi)

| SUB-TASK                             | ACTOR      | ACTION   | COGNITIVE EFFORT | COST        |
|--------------------------------------|------------|--|------------------|-------------|
| 1                                    | Customer   | The Customer clicks the “Register User” button   | Remember (1)     | $1 * 0 = 0$ |
| 2                                    | CRM System | The System displays the Registration Form (Figure below)   |                  |             |
| 3                                    | Customer   | The Customer fills the form by entering his “Customer Parameters” Class elements (shown below) in the appropriate boxes. | Remember (1)     | $1 * 0 = 0$ |
| 4                                    | Customer   | The Customer complete the registration by clicking the “Complete Registration” Button                                    | Remember (1)     | $1 * 0 = 0$ |
| <b>Total “Customer Registration”</b> |            |  |                  | <b>0</b>    |

| Registration Form   |  | ○ ○ ○ |              |           |            |             |             |              |    |    |    |   |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |    |    |  |
|---|--|-------|--------------|-----------|------------|-------------|-------------|--------------|----|----|----|---|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----|----|--|

**Total “Configure Ingestion System”** **11.7**

The previous use case is part of the larger process of configuring various systems, which is an approximate representation of a human glue mechanism. Indeed, those steps which require a low cognitive effort (steps 5 to 8), imply a previous human interaction in which the data analyst received the information needed.

Preparation System Configuration Panel

The interface is titled "Preparation System Configuration Panel". It features a header with three circular icons (two white, one blue). Below the title is a section titled "Mobility Sessions Features" containing a list of checkboxes. Some checkboxes are checked (blue) and some are unchecked (gray). The checked items are: "Pressure Mean Value", "Pressure Variance", "Age", "Weight", and "Category". The unchecked items are: "Interquartile Pressure Range" and "Height". At the bottom of the list is a large blue "Confirm" button.

| Mobility Sessions Features          |                              |
|-------------------------------------|------------------------------|
| <input checked="" type="checkbox"/> | Pressure Mean Value          |
| <input checked="" type="checkbox"/> | Pressure Variance            |
| <input type="checkbox"/>            | Interquartile Pressure Range |
| <input checked="" type="checkbox"/> | Age                          |

### 3.4. GENERATE MOBILITY SESSIONS SET – Use cases

#### 3.4.1 CONFIGURE SEGREGATION SYSTEM – Use Case (Lorenzo Tonelli)

##### *Segregation System Parameters*

**MinSessionsClass:** For each class defined in our Mobility Behavior Monitoring Application, a minimum number of sessions has been defined in order to build a sufficiently large Machine Learning Dataset.

**ToleranceTh:** This is a percentage value (e.g 10%, 5%) used to define a interval in which we tolerate data unbalancing. The tolerance threshold is applied on the average of ALL classes (not for each couple of classes).

**MaxLowQualitySessions:** Before sending the dataset to Development System, Data Analyst check the data quality of sessions. The number of low quality sessions we can accept is defined by this parameter. To compare the session quality is used a description quality file given during configuration time.

| SUB-TASK | ACTOR        | ACTION   | COGNITIVE EFFORT | COST              |
|----------|--------------|--|------------------|-------------------|
| 1        | System       | The <b>System</b> shows the Configuration Message                                    |                  |                   |

Total “Check Data Balancing”

9.61

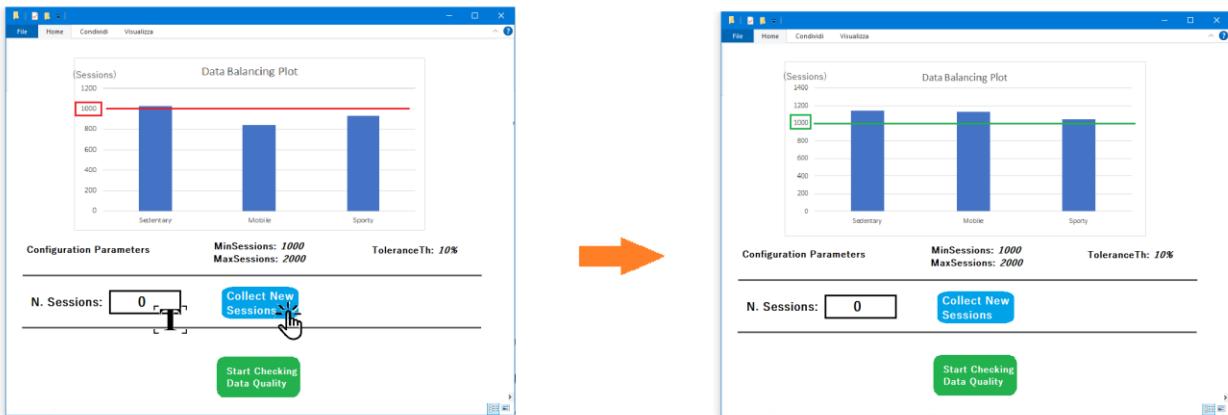

Figure 1 – The plot on the left shows that there are classes with not enough sessions. The user specifies the number of new sessions desired and then click on button “Collect New Sessions”. The plot on the right shows that new sessions has been stored in the segregation system and the minimum number of sessions for each class has been reached.

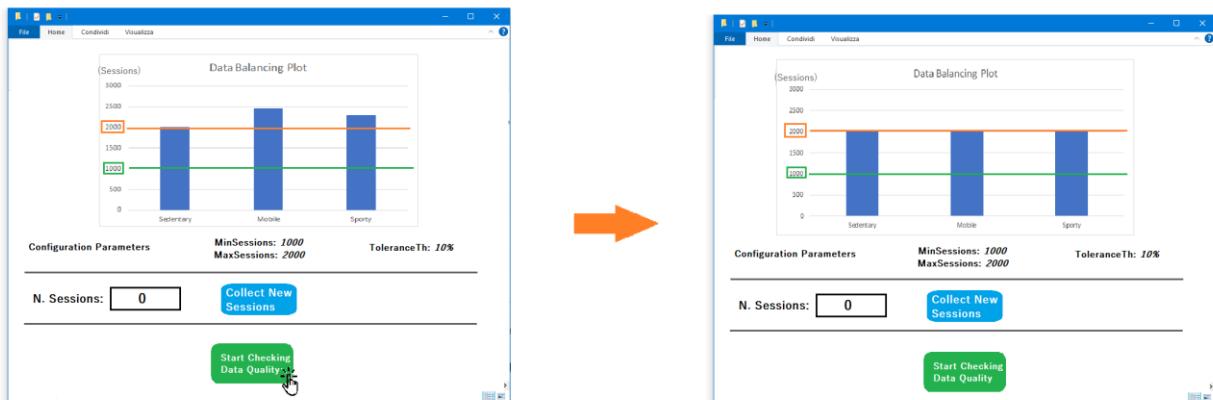

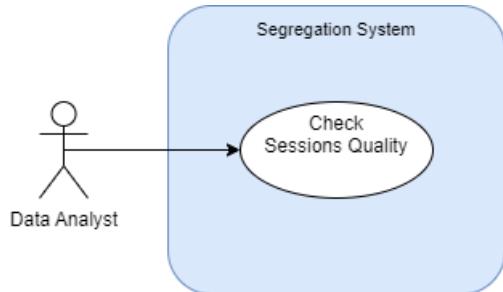

Figure 2 – The data distribution is highly unbalanced due to ‘Sporty’ class. The user can cope that removing some sessions in random way on the ‘Sporty’ class. The user has to define the number of sessions to remove; specify the name of class on which remove sessions; finally click on the “Remove Sessions button”. On the right we can see that data are balanced.

### 3.4.3 CHECK SESSIONS QUALITY – Use Case (Fabio Malloggi)

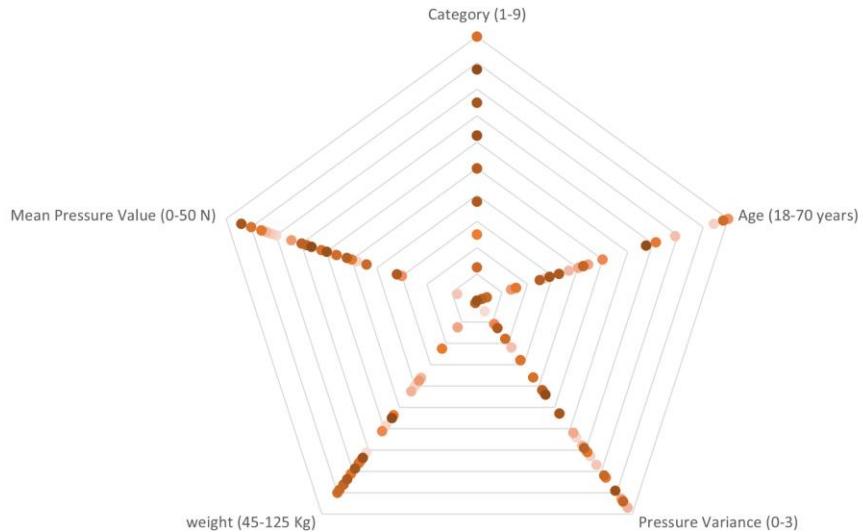

### ***Check Sessions Quality***

### 3.6. CLASSIFY MOBILITY SESSION – Use Cases

#### 3.6.1. CONFIGURE EXECUTION SYSTEM - Use Case (Ludovica Cocchella)

*Set number of classifications to do before switching from execution to monitoring mode and vice versa*

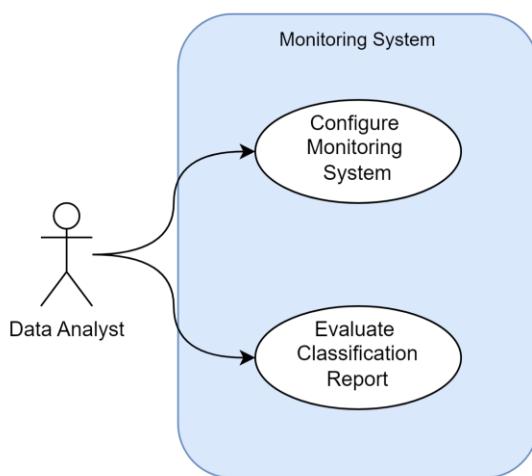

The screenshot shows a software window titled "Execution Panel". The main tab is "Configuration Parameters". Inside, there's a section for "Configure Number of Classification for each mode:" with two input fields: "Execution Window" (set to 1000) and "Monitoring Window" (set to 50). Below this, there are sections for "Configure Server Endpoints:" under "Monitoring System" and "Mobility Annotation Orthopedic System". Each endpoint has an IP Address field (192.0.1.14 and 192.168.1.3 respectively) and a Port Number field (1360 and 1234). At the bottom is a large blue "Save" button with a hand cursor icon pointing to it.

### 3.7.2. EVALUATE CLASSIFICATION REPORT - Use Case (Ludovica Cocchella)

*Check Mobility Classifier Performance*

The Monitoring Panel interface displays a Classification Report and performance metrics. The Classification Report table shows 8 rows of data with columns: Expert Label, Classifier Label, and Result. The results are: (2, 2, ✓), (1, 3, ✗), (5, 5, ✓), (4, 2, ✗), (3, 4, ✗), (5, 4, ✗), (1, 1, ✓). To the right, two counters are shown: Consecutive Errors (3) and Total errors (4). Below these are boxes stating: "Max number of consecutive errors tolerated (th1): 2" and "Max number of errors tolerated (th2): 5". At the bottom are two buttons: "Classifier works good" and "Re-train Classifier" (with a hand cursor icon).

| CLASSIFICATION REPORT |                  |        |

## 4. SIMULATION MODELS

### 4.1. AS-IS Model

The assumptions we make in order to simulate the process are the following:

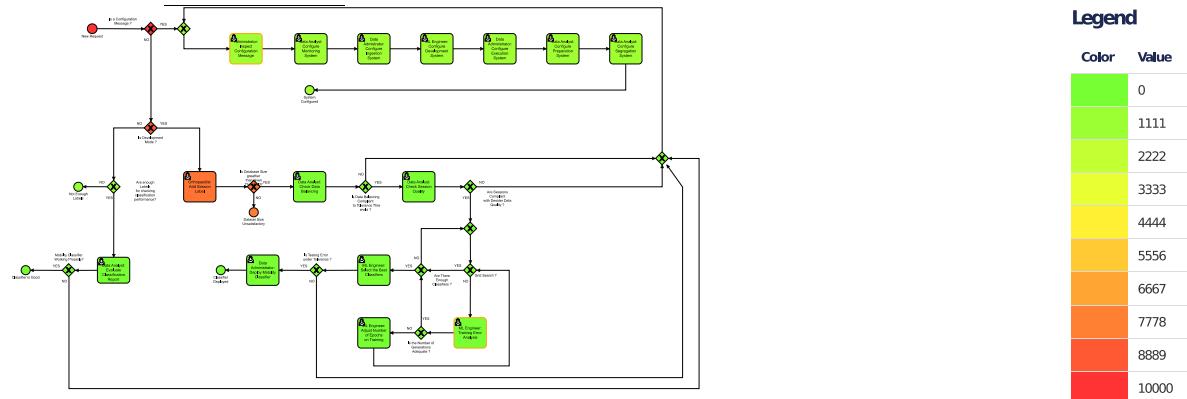

- Suppose 10,000 tokens are enough to emulate the behavior of a company in its operational phase. Out of these 10000 tokens, about 10% are reconfiguration messages, the rest are new sessions. So, we have 9000 sessions and 1000 reconfiguration messages
- Of the 9000 sessions, we assume that 90% are related to classifier development, while the remaining 10% are monitoring sessions.
- Of these 8100 tokens, they partially represent the sessions that are used to build the dataset necessary for the subsequent training of the classifier. To build the dataset, some situations have been considered:
  - 1) it is large enough (10% yes and 90% no)
  - 2) the dataset obtained is balanced according to the data imbalance tolerance threshold (33% yes and 67% no)
  - 3) the quality of the dataset complies with the desired data quality (60% yes and 40% no).
- The remaining tokens, which we want at least 500, are used to be consumed by the human tasks related to classifier training.
- We expect that the task related to the use of the classifier is reached by a few tokens (at most 20 times). In order to reflect the behavior of a company in its operational phase.

| GATEWAY   | TYPE | ACTION | PERCENTAGE |
|---|------|--------|------------|
| Are Sessions Compliant with Desider Data Quality? | XOR  | YES    | 60%        |
|   |      | NO     | 40%        |
| Are There Enough Classifiers?                     | XOR  | YES    | 85%        |
|   |      | NO     | 15%        |
|   | XOR  | YES    | 3%         |

|  |     |     |     |
|--|-----|-----|-----|
| Are enough Labels for checking classification performance? |     | NO  | 97% |
| Grid Search?   | XOR | YES | 80% |
|  |     | NO  | 20% |
| Is Data Balancing Compliant to Tolerance Threshold?        | XOR | YES | 33% |
|  |     | NO  | 67% |
| Is Database Size greater than given Threshold?             | XOR | YES | 3%  |
|  |     | NO  | 97% |
| Is Development Mode?                                       | XOR | YES | 40% |
|  |     | NO  | 60% |
| Is Testing Error under Tolerance?                          | XOR | YES | 90% |
|  |     | NO  | 10% |
| Is a Configuration Message?                                | XOR | YES | 10% |
|  |     | NO  | 90% |
| Is a Registration Request?                                 | XOR | YES | 90% |
|  |     | NO  | 10% |
| Is the Number of Generations Adequate?                     | XOR | YES | 40% |
|  |     | NO  | 60% |
| Mobility Classifier Working Properly?                      | XOR | YES | 85% |
|  |     | NO  | 15% |

## 4.2. TO-BE Model

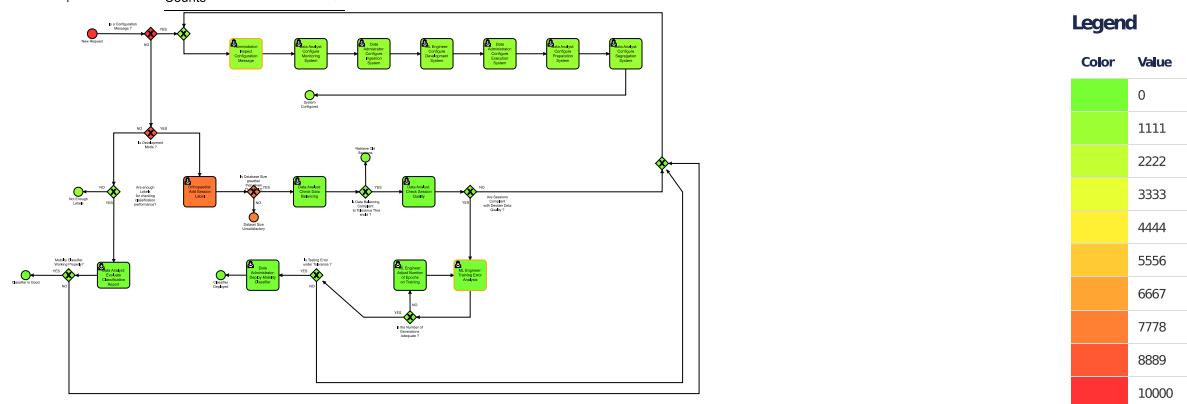

The TO-BE model was created starting from the AS-IS model adding three improvements to the processes:

- 1) at handoff level: balance classes by taking minor data from old sessions database.
- 2) at service level: Since the Best hyperparameters are retrieved on the history of already developed classifiers, once the number of training epochs is defined, a single classifier has been trained and no more grid search and selection of the best classifier must be performed.
- 3) at task level: the total cognitive effort of the task “adjust number of epochs on training” has been reduce from 17.38 to 16.01.

#### 4.3. BIMP Conclusion

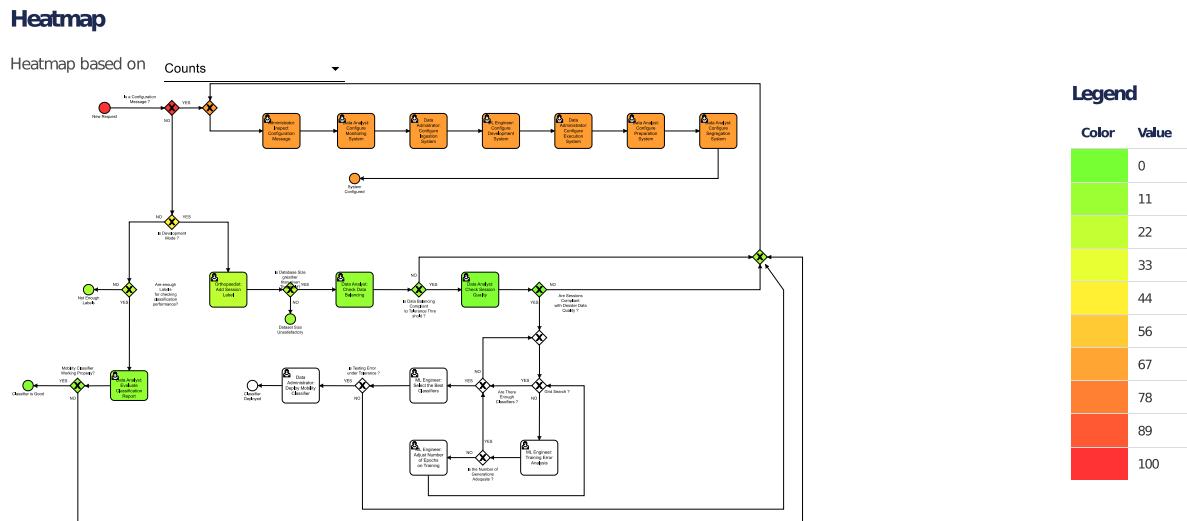

The simulation results of the TO-BE model demonstrate that the three performed improvements have reduced the maximum process instance time by **11%**, from 3.4m to 3m; while for the average process instance time the improvement is **12%**, from 22.6s to 19.9s.

## 5. PROCESS MINING

### 5.1. Normative Process Mining and Evaluation

#### 5.1.1 Bimp Normative Log Generation for Mining

We calculated the heatmap and simulation log using the value of cost, resources and gateway percentage suggested on the vision document and we obtained the following result:

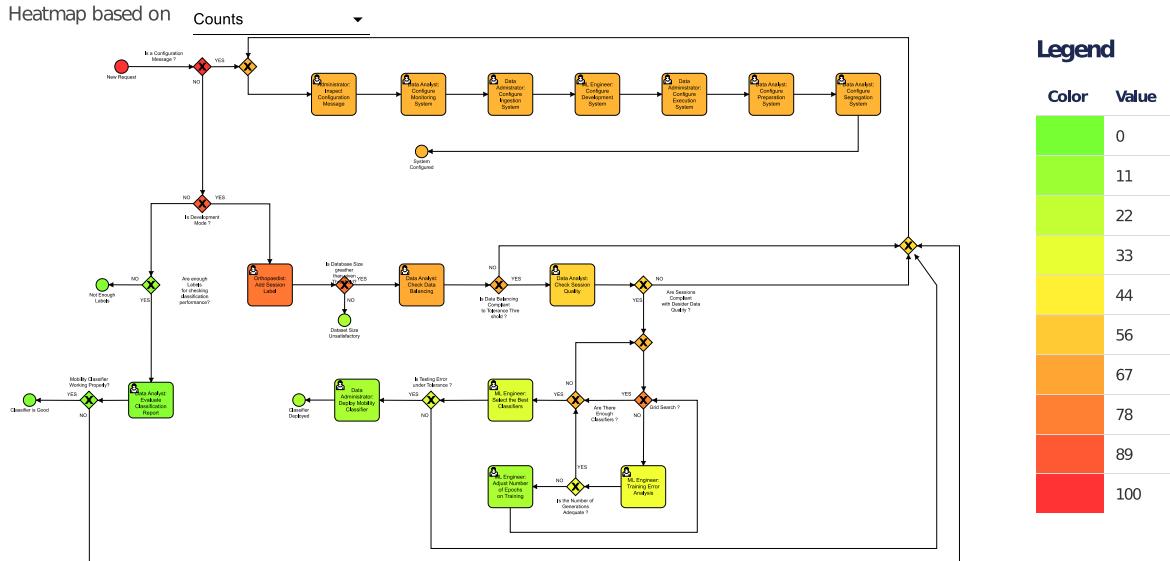

From the previous image we can notice that using these percentage split values for the gateways some scenario never happens, e.g. the human task “Deploy Mobility Classifier”. Since we want to distribute tokens to every task, we decide to modify percentage value of some gateways:

- “Is a configuration Message?” -> YES: 10% and NO: 90%
- “Is a Development Mode?” -> YES: 15% and NO: 85%
- “Is Dataset greater than given threshold?” -> YES: 10% and NO: 90%
- “Is Data Balancing Compliant to Tolerance Threshold?” -> YES: 90% and NO: 10%

After doing these modifications we obtained the following result:

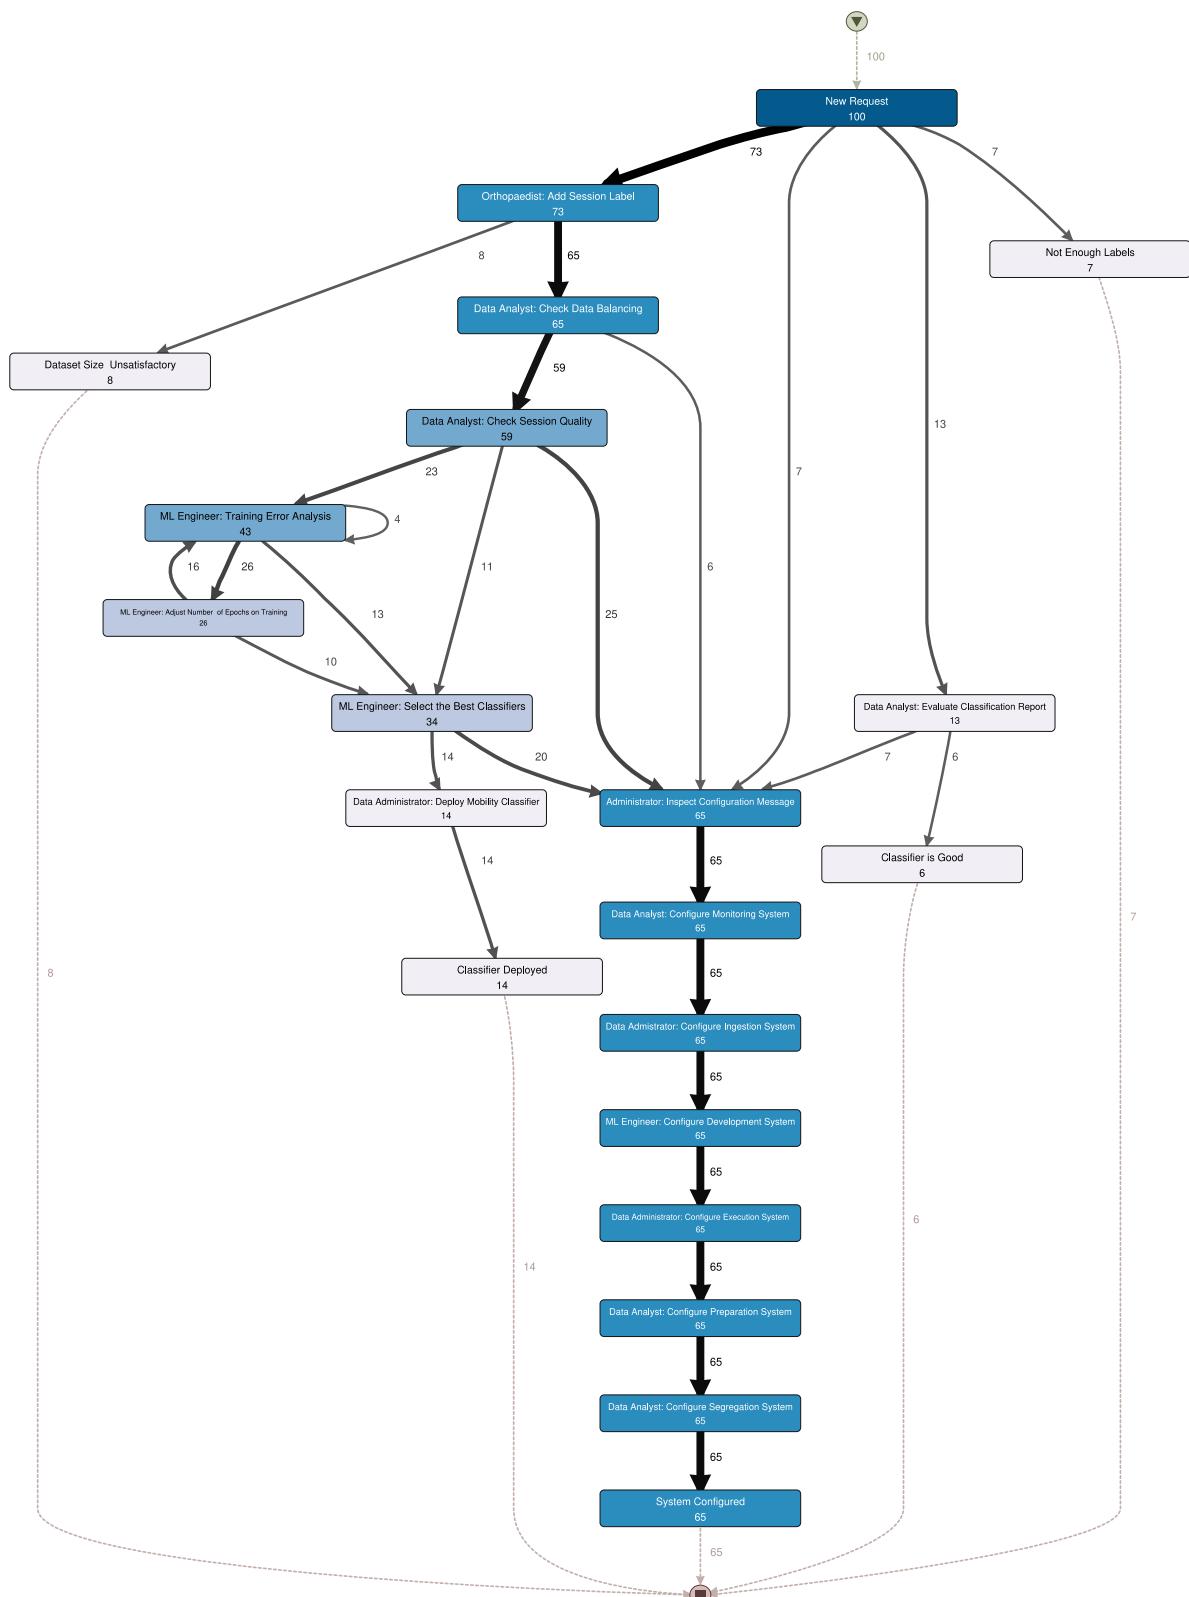

## Heatmap

We observed now that every task has received at least one token.

### 5.1.2 Disco Normative Model

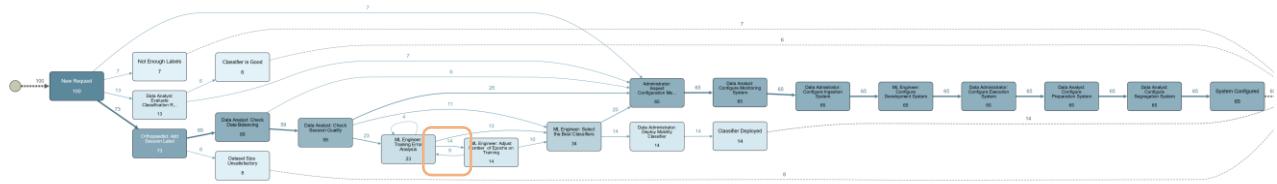

We imported on Disco the simulation log retrieved on BIMP and we obtained the following transition map:

Then we exported the log in CSV format adding endpoints.

We can observe that the transition map extracted from DISCO complies with the log generated by the simulation on the AS-IS model on BIMP.

### 5.1.3 Apromore Normative Model

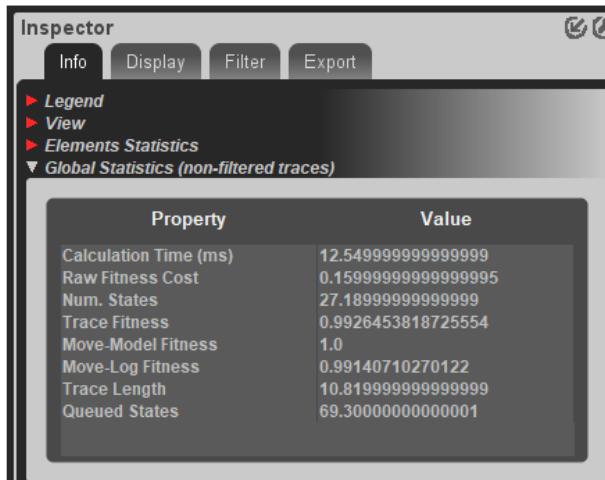

### 5.1.4 Comparison between Disco Transition Map and Apromore Process Map

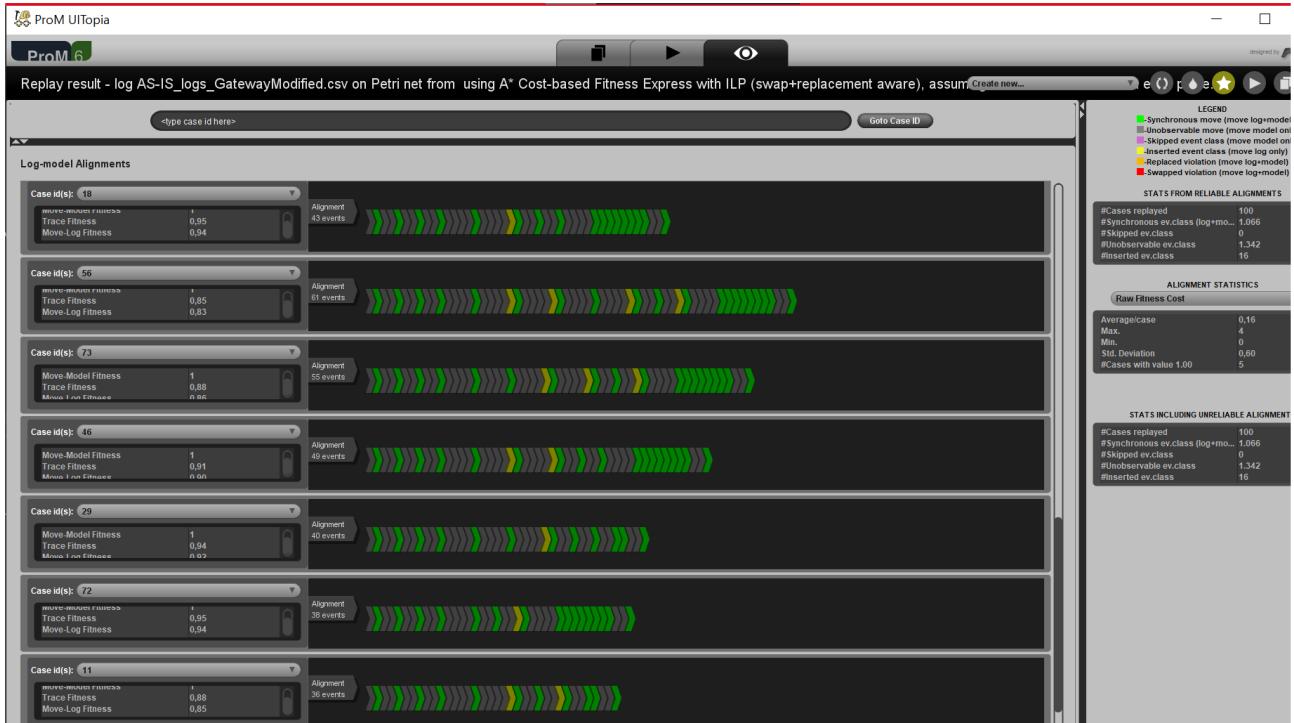

Although there is a small difference in occurrences in the 2 Maps between the reciprocal workflows between the tasks “Training Error Analysis” and “Adjust Number of Epochs on Training” (orange box), attributable to the different mining algorithms used by the two software, the two models perfectly match.

#### 5.1.4.1 Conformance Checking on Apromore BPMN Model

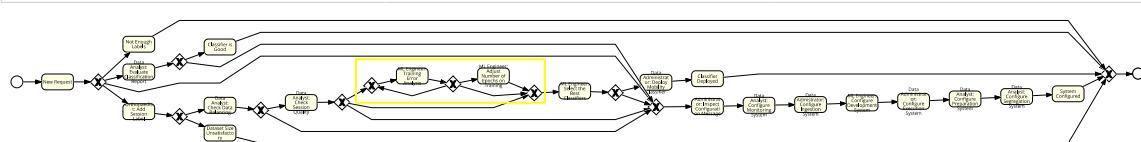

Starting from the logs obtained through the simulation on the AS-IS model on BIMP, we have, via DISCO, converted the format from MXML to XES and, on Apromore, we have generated a BPMN model (figure below), in addition to the transition map shown above. We imported this BPMN model obtained from Apromore and the logs obtained from BIMP into ProM. On ProM we converted the BPMN diagram into Petri-Net and we performed the conformance checking. The results of the conformance checking are shown in the following figures.

Being the fitness equal to 0.99, we can observe that the log is practically successfully replayed.

Apronmore BPMN Diagram

| Case    | Relevant Trace   |
|---------|--|
| 18      | Training Errors Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis   |
| 56      | Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis -> Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis -> Select the Best Classifier |
| 73      | Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis -> Select the Best Classifier  |
| 46      | Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis  |
| 29 – 11 | Training Error Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis  |
| 72      | Adjust Number of Epochs on Training -> Training Error Analysis -> Select the Best Classifier   |

All of those cases are considered Violations because does not exist the direct workflow from “Adjust Number of Epochs on Training” to “Training Error Analysis”.

### 5.1.5 ProM Normative Model

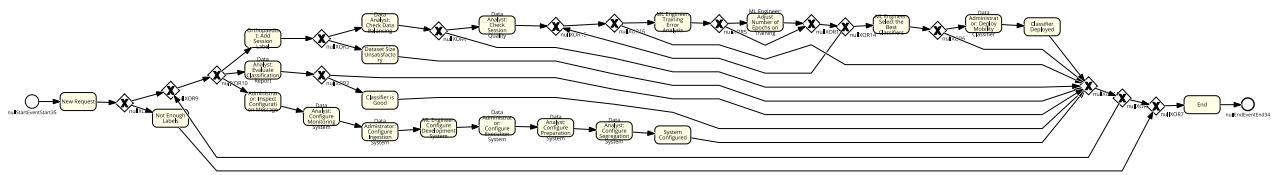

Starting from the BIMP mxm log file, we added the Endpoints (resulting in the addition of the only End Event) while converting the file to csv format on Disco.

We imported the CSV in ProM (with the related plugin) and converted it in XES by selecting only the time of process end; the resulting XES can be used as a log in ProM. Before doing the discovery, we apply on the XES file the following filters:

- Enhance Log: Remove all ‘non-standard’ attributes (In Place)
- Enhance Log: Repair Event Log (In Place)

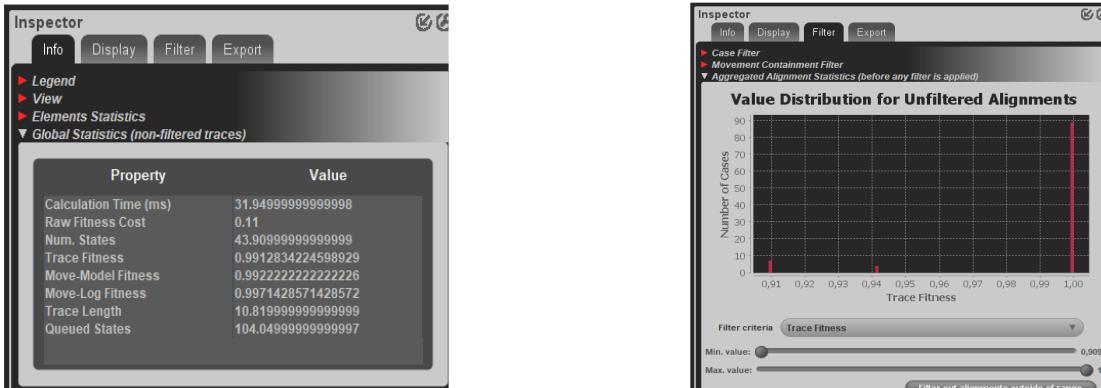

#### 5.1.5.1 Discovery

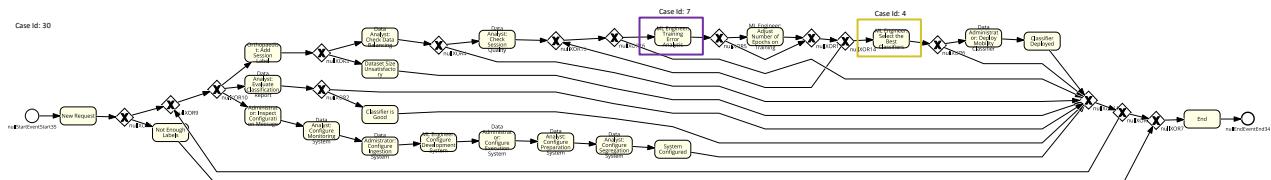

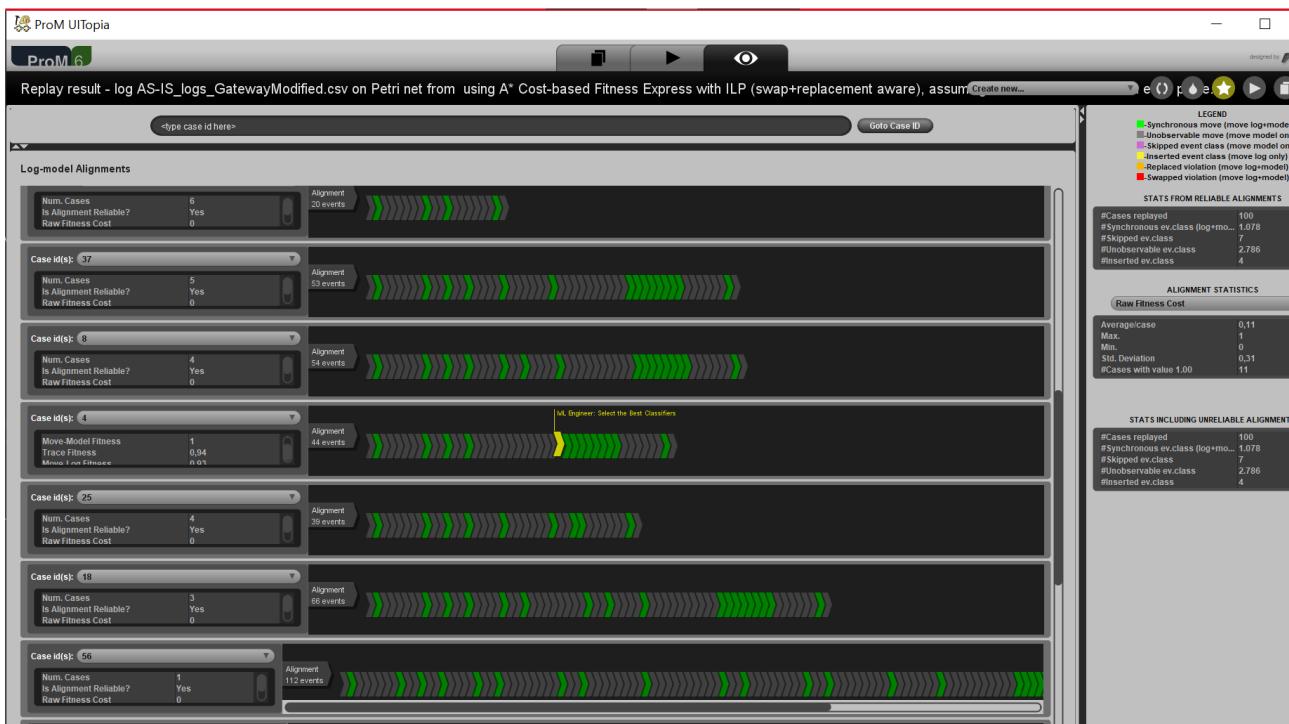

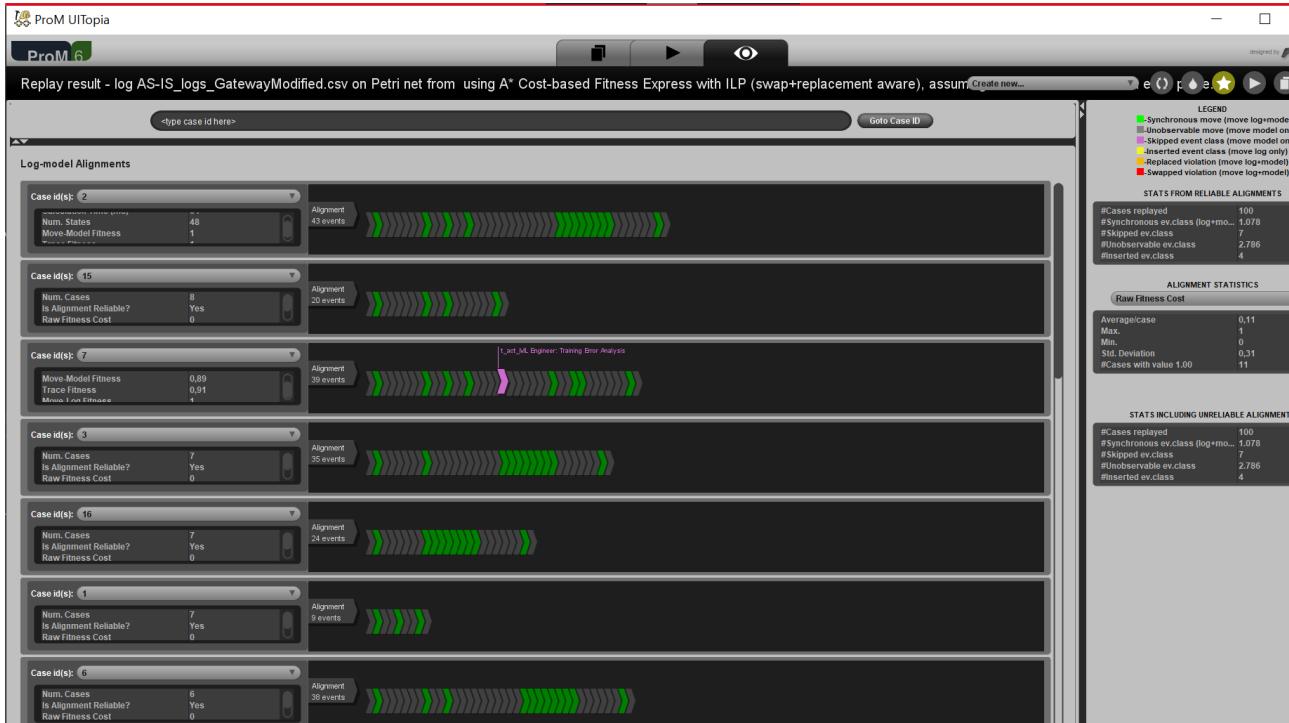

We applied on the XES file the **Inductive Miner Algorithm** and we obtained the following BPMN Diagram

#### 5.1.5.2 Conformance checking

In order to do the conformance checking analysis we need to convert the BPMN Diagram into Petri Net Diagram. After that we executed “Replay a Log on Petri Net for Conform Analysis” using the Petri Net Diagram and the XES file as input and the results that are obtained are as follows:

| Case | Relevant Trace   | Color Legend  |
|------|--|---------------|
| 7    | Check Session Quality -> Training Error Analysis -> Select Best Classifier | Skipped Event |

|   |   |                |
|---|---|----------------|
| 4 | Check Session Quality -> <b>Select Best Classifier</b> -> Inspect Configuration message | Inserted event |
|---|---|----------------|

The two violations can be attributed to the problem that ProM Mined Model did not represent the direct workflow from “Check Session Quality” to “Select Best Classifier”.

Indeed, the first violation ‘skipped event’ would have fit the model if such direct workflow was present.

The same is true for the second violation because, missing such direct workflow, the ProM software chose the shortest path from “Check Session Quality” to “Inspect Configuration Message” and inserted the middle event as a violation.

#### 5.1.5.3. Quality Dimension Analysis

The quality dimensions are four and beyond the fitness value there are other dimensions of quality which are the following:

86 workflows, 15 gateways

- **Simplicity (#gateways + #sequence flows + #activities) = 86**
- **Precision = 0,70633**
- **Generalization = 0,99851**

## 5.2. Normative Process Evaluation against Log Violations

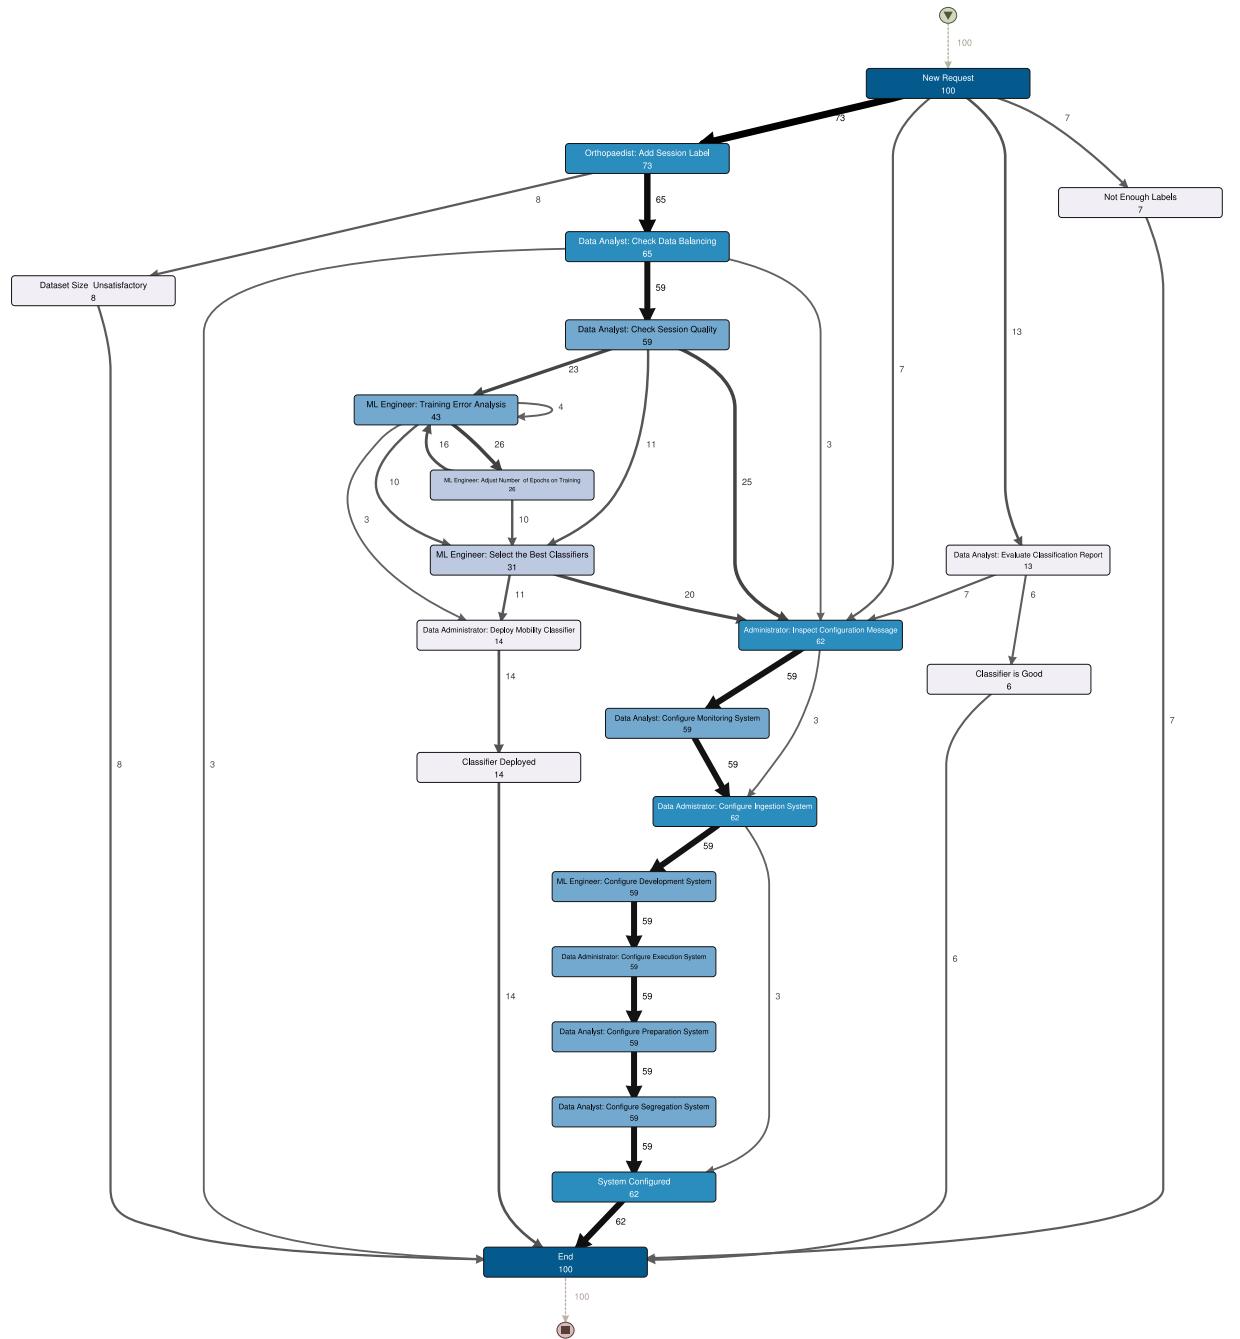

### 5.2.1. Introducing Log Violations

The log has been modified introducing three types of violations:

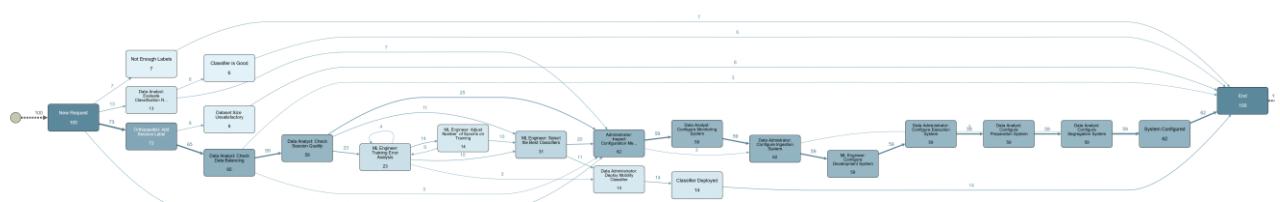

- The first emulates the behavior of a data analyst who, in case of unbalanced dataset, solves the issue by taking minor data from old sessions database stored in the segregation system instead of requesting new data by sending a message to the configuration system.
- The second emulates the behavior of a Machine Learning Engineer who trains the classifier choosing as hyperparameters the ones retrieved on the history of already developed classifiers, such that no grid search and selection of the best classifier must be performed.
- The third concerns configuration messages. There are situations where it is not necessary to configure all systems but only the ingestion system.

It is fair to remember that the violations introduced are legal and do not compromise the quality of service offered by the company.

### 5.2.2 Disco Model with Violations

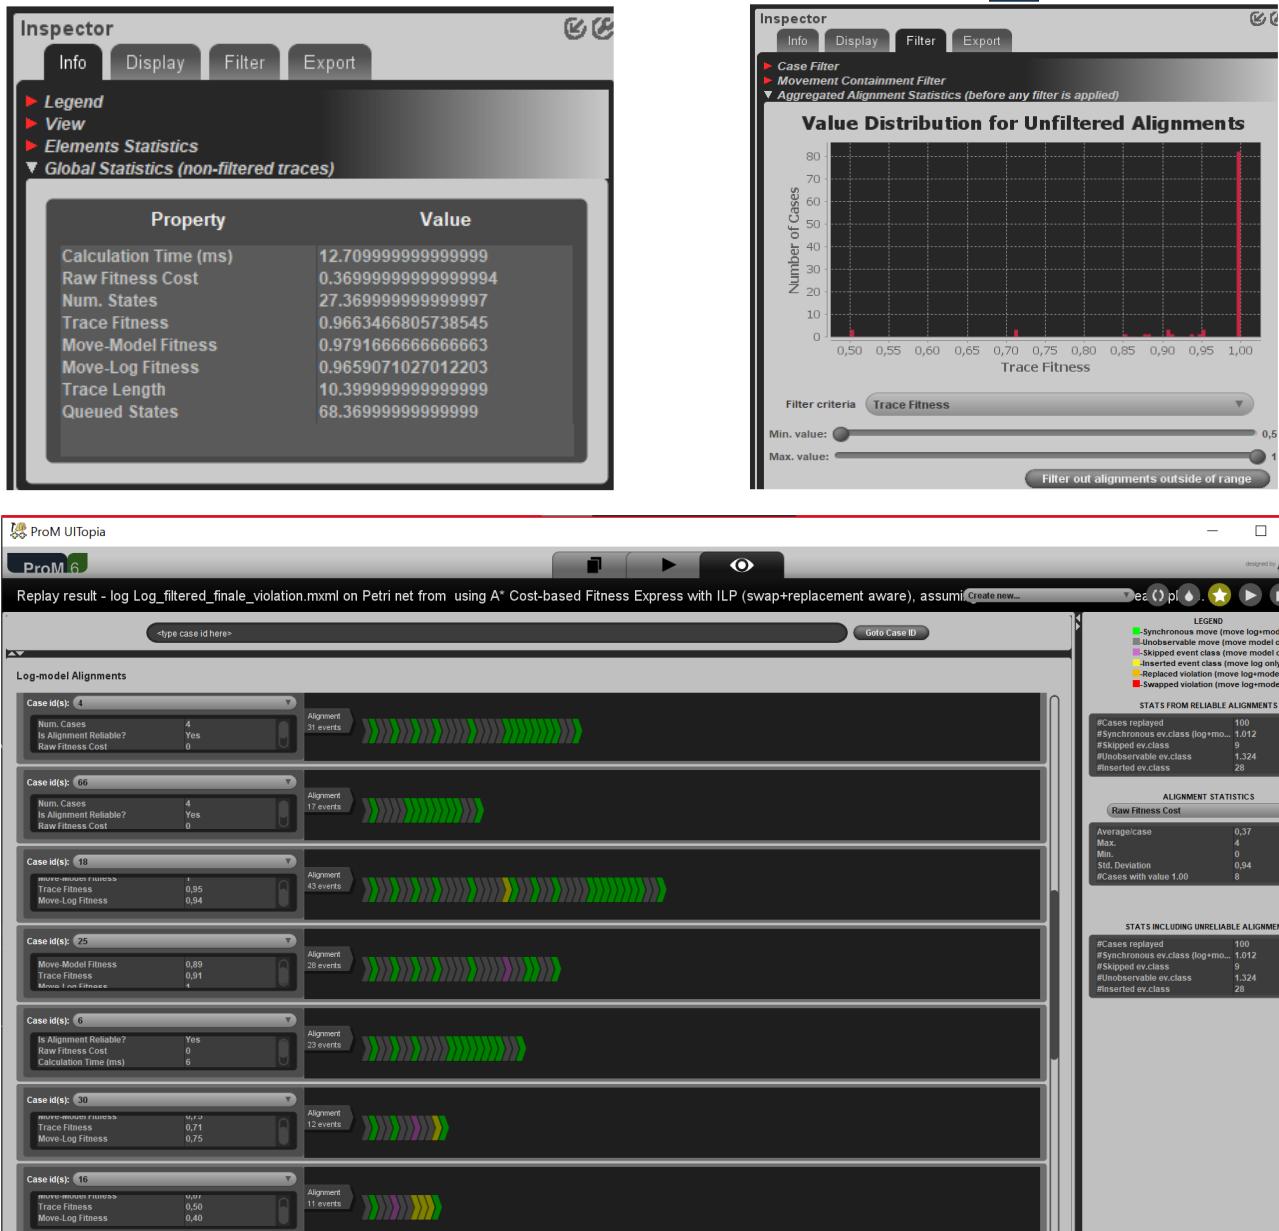

### 5.2.3. Apromore Model with Violations

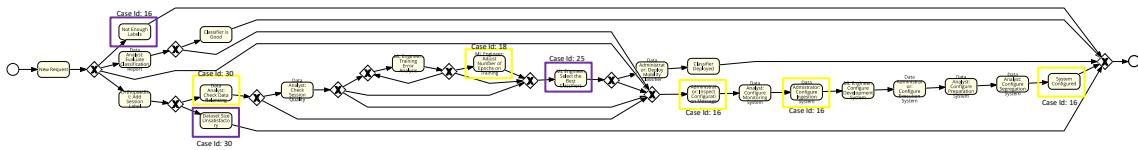

#### 5.2.4. Comparison between Disco and Apromore Models with Violations

Although there is a small difference in occurrences in the 2 Maps between the reciprocal workflows between the tasks “Training Error Analysis” and “Adjust Number of Epochs on Training”, attributable to the different algorithms used by the two software, the two models perfectly match.

#### 5.2.5. Conformance Checking Apromore Normative Model against Violations

## Apromore BPMN Diagram

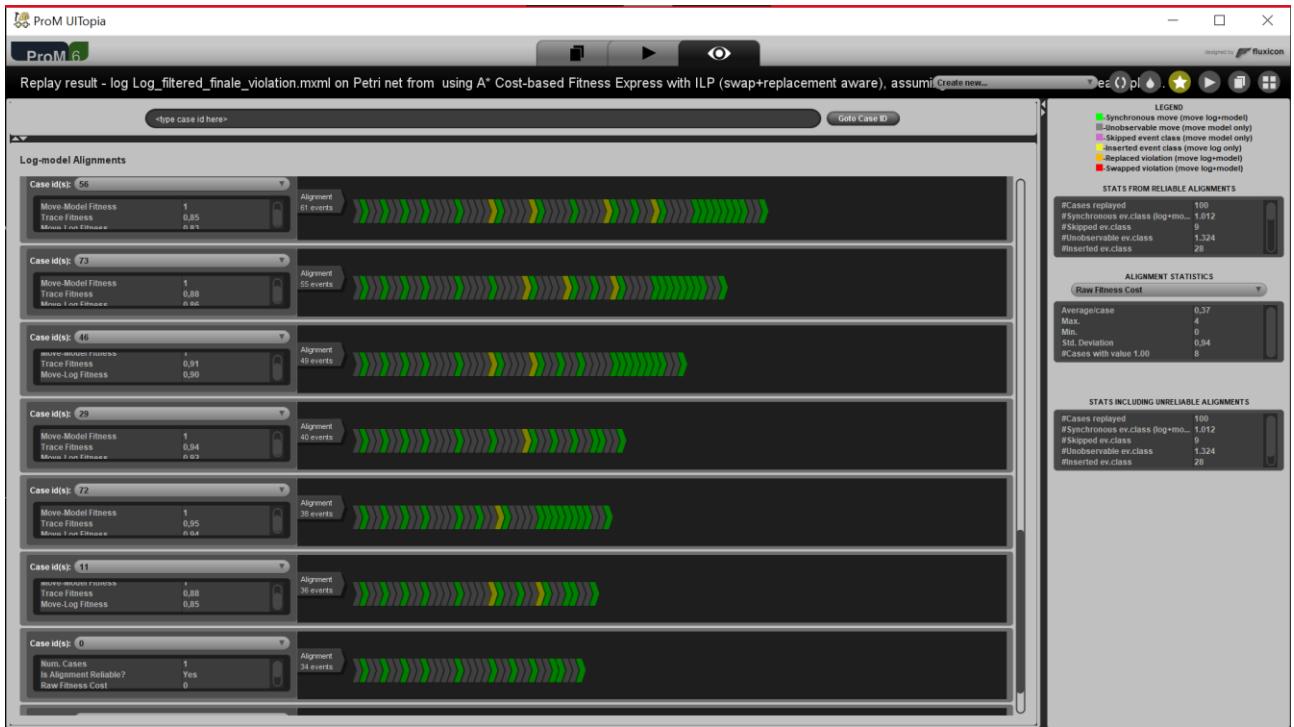

| Case | Relevant Trace   |
|------|--|
| 18   | Training Errors Analysis -> Adjust Number of Epochs on Training -> Training Error Analysis                                     |
| 25   | Training Errors Analysis -> Select the best Classifier -> Deploy Mobility Classifier   |
| 16   | New Request -> Not Enough Labels -> Inspection Configuration Message -> Configure Ingestion System -> System Configured -> End |
| 30   | New Request -> Add Session Label -> Dataset Size Unsatisfactory -> Check Data Balancing -> End                                 |

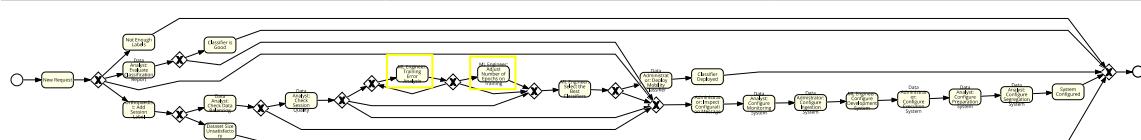

The Log Case 16 was modified to introduce the violation in the configuration process by skipping 5 configuration tasks. Indeed, it was modified to follow the following path: “New Request” -> “Inspect Configuration Message” -> “Configure Ingestion System” -> “System Configured” -> “End”.

We suppose that the problem regarding the event “Not Enough Labels” recognized as ‘skipped event’ (violet) and the events “Inspection Configuration Message”, “Configure Ingestion System” and “System Configured” recognized as ‘inserted events missing in the model’ (yellow) can be attributed to the intrinsic functioning of the ProM Software itself.

Indeed, analyzing the path that Log case ID 16 would fit the most, once the ProM algorithm recognized the first (“new Request”) and last (“End”) events within the Model, it probably chooses among the possible path connecting those events the one with the lowest number of Violations (and not the one with the highest number of matching). Since there exists the path with only one event (“Not Enough Labels”) it was chosen as the path of the Log Cases 16, thus labelling incorrectly the events as above.

Apronmore BPMN Diagram

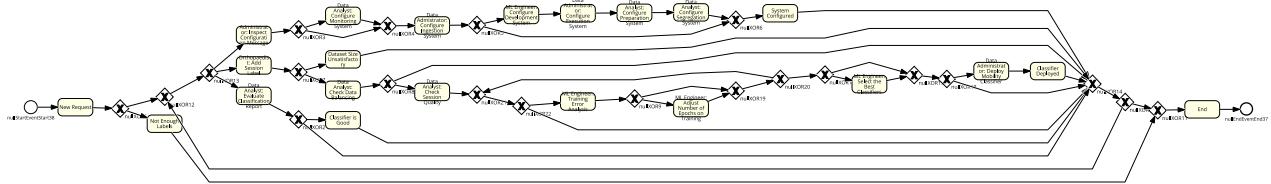

| Case    | Relevant Trace  |
|---------|---|
| 56      | Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis -> Select the Best Classifier |
| 73      | : Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis -> Adjust Number of Epochs on Training -> <b>Training Error Analysis</b> -> Select the Best Classifier  |
| 46      | Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis   |
| 29 – 11 | Training Error Analysis -> <b>Adjust Number of Epochs on Training</b> -> Training Error Analysis  |
| 72      | <b>Adjust Number of Epochs on Training</b> -> <b>Training Error Analysis</b> -> Select the Best Classifier  |

Most of those cases are considered Violations because does not exist the direct workflow from “Adjust Number of Epochs on Training” to “Training Error Analysis”.

## 5.2.5. ProM Model against Violations

### 5.2.5.1 Discovery

We applied on the XES file the Inductive Miner Algorithm and we obtained the following BPMN Diagram

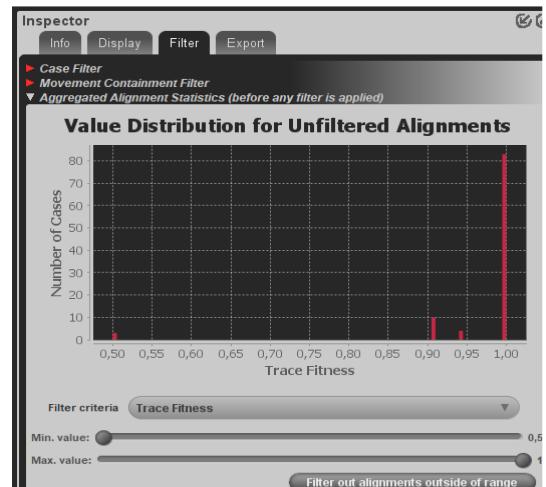

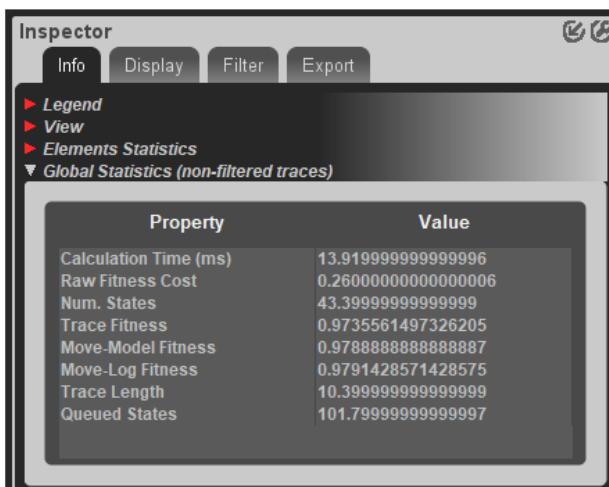

### 5.2.5.2. Conformance Checking

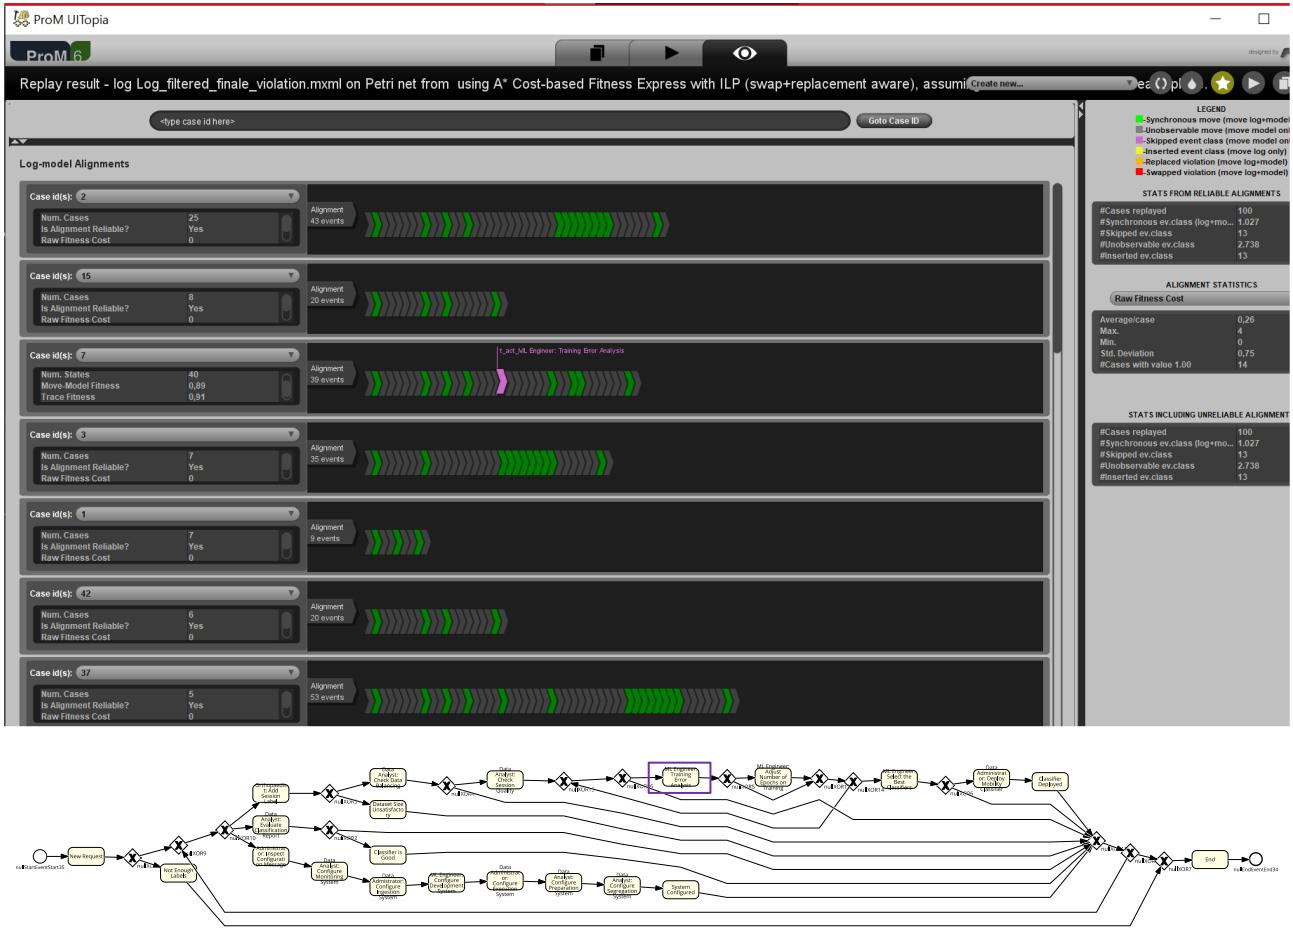

After modifying manually, the csv for introducing the violation, we performed conformance checking using the log with violations and the results we got are as follows:

From the panel we can see that some violations have been revealed.

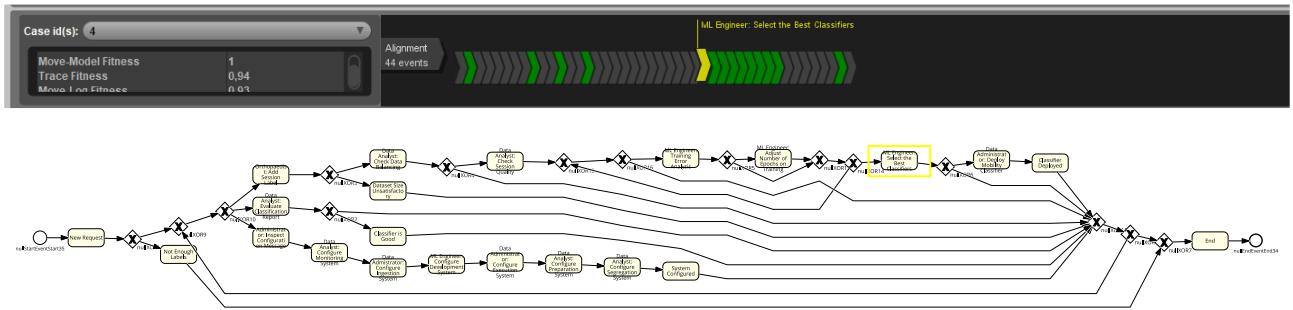

All violations were found where the classifier is used without choosing the best one. We can see the yellow arrow indicating the select best classifier event was expected in the diagram.

The violations related to the "check data balancing" task have not been identified (red square). From the panel we notice that the arrows are green despite this behavior of the token was not accepted in the as-is model. We can find the answer by looking at the BPMN diagram obtained on ProM. The diagram has introduced many XOR leading to generalize and therefore accept any unwanted behavior of the company's users. This can be dangerous because a high generalization of the model could hide dangerous user's violations. The yellow arrow we see in the previous picture shows the violations introduced regarding the configuration of the various systems.

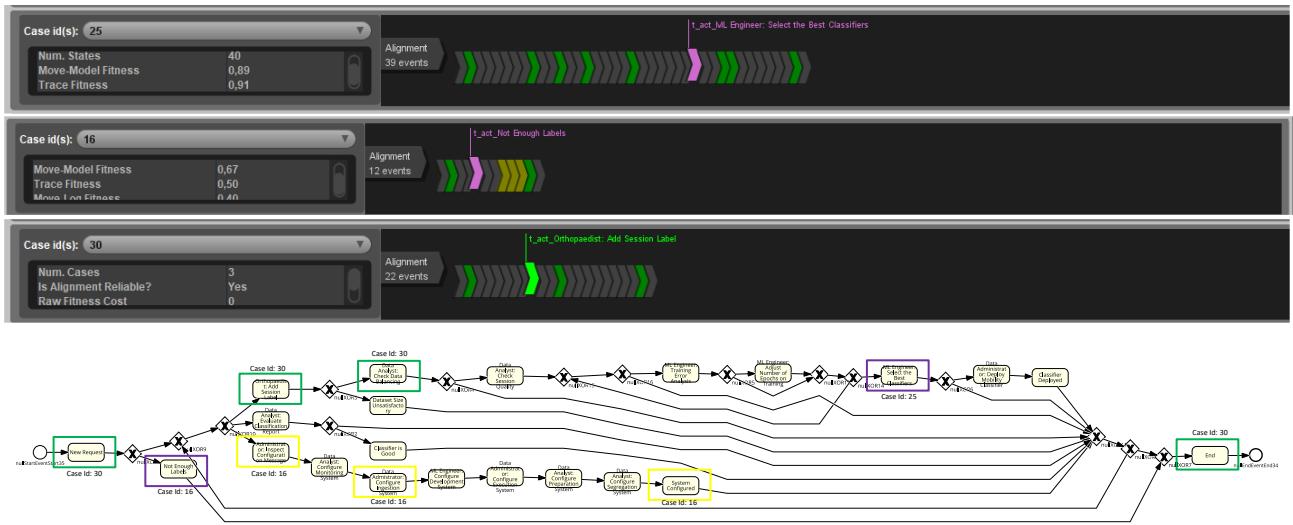

| Case | Relevant Trace   |
|------|--|
| 7    | Check Session Quality -> Training Error Analysis -> Select Best Classifier |

| Case | Relevant Trace   |
|------|--|
| 4    | Check Session Quality -> Select Best Classifier -> Inspect Configuration message |

| Case | Relevant Trace   |
|------|--|
| 25   | New Request -> Select the best Classifier -> Deploy Mobility Classifier  |
| 16   | New Request -> Not Enough Labels -> Inspection Configuration Message -> Configure Ingestion System -> System Configured -> End |
| 30   | New Request -> Add Session Label -> Check Data Balancing -> End  |

Same explanation of the paragraph 5.2.5.

#### 5.2.5.3. Quality Dimension Analysis

The quality dimensions are four and beyond the fitness value there are other dimensions of quality which are the following:

- **Simplicity = 101**
- **Precision = 0,71000**
- **Generalization = 0,99831**

21 gateways, 58 workflows

### 5.3 Evaluate Models Quality Dimensions

In this paragraph, the values of the four quality dimensions of the mined models have been reported.

The first section we compared the apromore and ProM (inductive miner) models using the log obtained from the as-is model.

The second section concerns a comparison for the same models seen in the previous section but using the log with some violations introduced.

The last section is about a comparison of apromore (inductive miner) models.

### 5.3.1. Comparison between Apromore and ProM Models Quality Dimensions

|                                 | <b>Simplicity</b> | <b>Precision</b> | <b>Generalization</b> | <b>Fitness</b> |
|---------------------------------|-------------------|------------------|-----------------------|----------------|
| <b>ProM</b> Normative Model     | 86                | 0.7063           | 0.99851               | 0.9912         |
| <b>Apromore</b> Normative Model | 74                | 0.9274           | 0.99862               | 0.9926         |

Looking at the table we can see that the Apromore model is less complex and more precise than the ProM mined model. This means that the apromore model would avoid behavior not seen by the event logs.

While for Generalization and Fitness the values are more or less equal. So, we can say that the model given by the Apromore software results to be better than the ProM model.

### 5.3.2. Comparison between Apromore and ProM Models Quality Dimensions with Modified Log

The models are the same as in the previous section, but the logs are different. Violations have been introduced in the logs in order to observe the variation of the quality quantities of the models. The conformance analysis of the models takes these modified logs as input.

|                                 | <b>Simplicity</b> | <b>Precision</b> | <b>Generalization</b> | <b>Fitness</b> |
|---------------------------------|-------------------|------------------|-----------------------|----------------|
| <b>ProM</b> Normative Model     | 86                | 0.71             | 0.99831               | 0.9735         |
| <b>Apromore</b> Normative Model | 74                | 0.9282           | 0.99853               | 0.9663         |

Although the fitness decreased for both models, but the Apromore model continues to have higher accuracy than the ProM model.

### 5.3.3. Comparison between ProM with and without Violations Models Quality Dimensions

|                                      | <b>Simplicity</b> | <b>Precision</b> | <b>Generalization</b> | <b>Fitness</b> |
|--------------------------------------|-------------------|------------------|-----------------------|----------------|
| <b>ProM</b> Normative Model          | 86                | 0.71             | 0.99831               | 0.9735         |
| <b>ProM</b> Improved Normative Model | 101               | 0.59635          | 0.99808               | 0.9912         |

#### 5.3.4. Comparison between Apromore with and without Violations Models Quality Dimensions

|  | <b>Simplicity</b> | <b>Precision</b> | <b>Generalization</b> | <b>Fitness</b> |
|--|-------------------|------------------|-----------------------|----------------|
| <b>Apromore</b><br>Normative Model             | 74                | 0.9282           | 0.99853               | 0.9663         |
| <b>Apromore</b><br>Improved<br>Normative Model | 92                | 0.73416          | 0.99810               | 0.9926         |
